

“Donald E. Scott: Probing Parker’s Solar Probe Data | Thunderbolts”

Electric Sun predictions are being verified by the latest data from the Parker Solar Probe. However, NASA invents phrases such as ‘pseudo-streamers’, ‘funnel structures’ and ‘switchbacks’ to describe what they see and find everything new to be “enigmatic.”

It’s not enigmatic. It is what the Electric Universe Model has been predicting for decades as an alternative to the gravity-only, lock-step narrative of the Standard Model.

Author and electrical engineer Donald E. Scott, PhD, deconstructs the NASA Goddard Space Flight Center press

release of December 14, 2021 announcing new results from the Parker Solar Probe. Dr. Scott presents a clear, accurate understanding of the real properties of electro-magnetic plasma dynamics that are being observed on our Sun.
